

To find out if a leak is in your irrigation system, follow these steps. Remember to first turn off all the water inside and outside your home.

**1.** Turn off the valves to your irrigation system and check the flow-indicator arrow. If it has stopped moving, you may have a leak in your irrigation system.

**2.** The first place to check is your valve box to see if there is any water pooling in or around the box.

**3.** You'll also want to walk your property to check for pools of water and look for bubbles under your turf where water may have gotten trapped.

**4.** All of these are indications that something is cracked or broken in your irrigation system. You will need to repair your irrigation system or hire a landscape professional to help. See our Water Smart Contractor section for tips.
